Important inequalities

Markov's inequality (CB Lemma 3.8.3 & HMC Thm 1.10.2)

- If $\Pr(X \geq 0) = 1$ and $\mathrm{E}X^k$ exists, then, for all $r, k > 0$,

$$\Pr(X \geq r) \leq \mathrm{E}X^k / r^k.$$

Chebychev's inequality (CB Thm 3.6.1 & Example 3.6.2 & HMC Thm 1.10.3)

- A corollary of Markov's inequality
- Let $X \sim (\mu_X, \sigma_X^2)$. Then, for each $r > 0$,

$$\Pr\{|X - \mu_X| \geq r\sigma_X\} = \Pr\{(X - \mu_X)^2/\sigma_X^2 \geq r^2\} \leq r^{-2}.$$

Cauchy-Schwarz inequality (CB Thm 4.7.3)

- X and Y are both r.v.s. Then $|\mathrm{E}(XY)| \leq \mathrm{E}|XY| \leq \sqrt{\mathrm{E}X^2}\sqrt{\mathrm{E}Y^2}$.
  - Because

$$\frac{X^2}{\mathrm{E}X^2} + \frac{Y^2}{\mathrm{E}Y^2} \geq \frac{2|XY|}{\sqrt{\mathrm{E}X^2}\sqrt{\mathrm{E}Y^2}}$$

Convexity and concavity

- Convex set: for any two points in the set, the whole line segment that joins them is also in the set
- Let $\mathcal{D}$ be a convex set. Then real-valued function $f : \mathcal{D} \to \mathbb{R}$ is convex $\iff$ $f(\lambda x_1 + (1-\lambda)x_2) \leq \lambda f(x_1) + (1-\lambda)f(x_2)$ for all $x_1, x_2 \in \mathcal{D}$ and all $\lambda \in [0, 1]$.
  - If f is twice-differentiable, then f is convex (on $\mathcal{D}$) $\iff$ $f''(x) \geq 0$ for each $x \in \mathcal{D}$.
- f is concave $\iff$ $-f$ is convex.

Example Lec17.1

- Check the convexity/concavity of following functions.
  a. $f(x) = \exp(x)$, $x \in \mathbb{R}$.
  b. $f(x) = \ln x$, $x \in \mathbb{R}^+$.
  c. $f(x) = x^2$, $x \in \mathbb{R}$.
  d. $f(x) = x^{-1}$, $x \in \mathbb{R} \setminus \{0\}$.
  e. $f(x) = x^{-2}$, $x \in \mathbb{R} \setminus \{0\}$.

Jensen's inequality (CB Thm 4.7.7 & HMC Thm 1.10.5)

- If f is convex on (a, b) and $\mathrm{E}X \in (a, b)$, then

$$\mathrm{E}\{f(X)\} \geq f(\mathrm{E}X).$$

Example Lec17.2

- Let X be a positive random variable, i.e., $\Pr(X > 0) = 1$. Argue that
  a. $\mathrm{E}(-\ln X) \geq \ln(1/\mathrm{E}X)$;
  b. $\mathrm{E}X^3 \geq (\mathrm{E}X)^3$.

Convergence of random variables

Definitions

- Convergence in probability (CB Def 5.5.1), say $X_n \xrightarrow{p} X$: for each $\varepsilon > 0$,

$$\lim_{n\to\infty} \Pr(|X_n - X| < \varepsilon) = 1, \quad \text{or equivalently,} \quad \lim_{n\to\infty} \Pr(|X_n - X| > \varepsilon) = 0.$$

- Almost sure convergence (CB Def 5.5.6), say $X_n \xrightarrow{\text{a.s.}} X$:

$$\Pr(\lim_{n\to\infty} X_n = X) = 1$$

  or equivalently, for each $\varepsilon > 0$,

$$\Pr(\lim_{n\to\infty} |X_n - X| < \varepsilon) = 1$$

- Convergence in distribution (CB Def 5.5.10), say $X_n \xrightarrow{d} X$: for each x with $\Pr(X = x) = 0$,

$$\lim_{n\to\infty} F_{X_n}(x) = F_X(x);$$

  or equivalently (and optionally), for each $t \in \mathbb{R}$,

$$\lim_{n\to\infty} \mathrm{E}\{\exp(itX_n)\} = \mathrm{E}\{\exp(itX)\};$$

  or equivalently (and optionally), for each f continuous and bounded within $\mathrm{supp}(X)$,

$$\lim_{n\to\infty} \mathrm{E}\{f(X_n)\} = \mathrm{E}\{f(X)\}.$$

  - For the third equivalent statement, the boundedness of f is essential. Hence the convergence in distribution doesn't imply the convergence of moments; see CB Example 10.1.10.

Example Lec18.1 (optional)

- Assume that $X(s) = 0$ for all $s \in [0, 1]$ and

$$X_n(s) = \begin{cases} 1, & s \in [\frac{n}{2^{\lfloor \log_2 n \rfloor}} - 1, \frac{n+1}{2^{\lfloor \log_2 n \rfloor}} - 1] \\ 0, & \text{elsewhere.} \end{cases}$$

  Then the convergence of X_n to X is in probability but NOT almost surely.

CB Example 5.5.11

- (Limiting distribution of the maximum of uniforms) if iid $X_1, \ldots, X_n$ follow $\mathrm{Unif}(0, 1)$, then $n(1 - X_{(n)}) \xrightarrow{d} \text{exponential}(1)$.

Connections

- The chain of implications
$$\xrightarrow{\text{a.s.}} \quad \Rightarrow \quad \xrightarrow{p} \quad \Rightarrow \quad \xrightarrow{d}$$

- (CB Thm 5.5.13 and Exercise 5.41) $X_n \xrightarrow{d}$ constant $c \Rightarrow X_n \xrightarrow{p} c$

- (Continuous mapping theorem) $h(\cdot)$ is continuous and $X_n \xrightarrow{\text{a.s.}/p/d} X \Rightarrow h(X_n) \xrightarrow{\text{a.s.}/p/d} h(X)$.

- $X_n \xrightarrow{\text{a.s.}/p} X$ and $Y_n \xrightarrow{\text{a.s.}/p} Y \Rightarrow$
  - $aX_n + bY_n \xrightarrow{\text{a.s.}/p} aX + bY$
  - $X_n Y_n \xrightarrow{\text{a.s.}/p} XY$

- (Slutsky's theorem, CB Thm 5.5.17) $X_n \xrightarrow{d} X$ and $Y_n \xrightarrow{d}$ constant $c \Rightarrow$
  - $aX_n + bY_n \xrightarrow{d} aX + bc$
    - The requirement that $Y_n \xrightarrow{d}$ constant c is important. Otherwise, consider the following counterexample: assuming $X_n, X, Y \sim \text{Unif}(-1,1)$ and $Y_n = -X_n$, one may find that $X_n \xrightarrow{d} X$ and $Y_n \xrightarrow{d} Y$ but $X_n + Y_n$ does not converge to $X + Y$ in distribution.
  - $X_n Y_n \xrightarrow{d} cX$

CB Exercise 5.43

- $\sqrt{n}(X_n - c) \xrightarrow{d} \mathcal{N}(0, \sigma^2) \Rightarrow X_n \xrightarrow{p} c$.

Laws of large numbers (LLN, CB Thm 5.5.2 & 5.5.9)

- If $X_1, X_2, \ldots$ are iid with finite mean μ, then
  - (Weak law of large numbers, WLLN) $\bar{X}_n \xrightarrow{p} \mu$;
    - Proof using Chebyshev's inequality (if assuming finite variance as well)
  - (Strong law of large numbers, SLLN) $\bar{X}_n \xrightarrow{\text{a.s.}} \mu$.

Central limit theorem (CLT)

- (CB Thm 5.5.15) if $X_1, \ldots, X_n$ are iid with finite mean μ and finite variance σ^2, then
$$\frac{\sqrt{n}(\bar{X}_n - \mu)}{\sigma} \xrightarrow{d} \mathcal{N}(0,1).$$
  - A generic approximation to the distribution of $\bar{X}_n$
  - By the Taylor's series about 0
    - Suppose g has derivative of order three within an open interval of x_0. Then, for x inside this open interval,
$$g(x) = g(x_0) + g'(x_0)(x - x_0) + \frac{1}{2}g''(x_0)(x - x_0)^2 + o\{(x - x_0)^2\}.$$

- (CB Example 5.5.18) assuming conditions for CLT and that $T_n \xrightarrow{d} \sigma > 0$,
$$\frac{\sqrt{n}(\bar{X}_n - \mu)}{T_n} \xrightarrow{d} \mathcal{N}(0,1).$$
  - by the CLT and Slutsky's theorem

CB Exercise 5.35 (optional)

- Derive the Stirling's formula: $n! \approx n^{n+1/2} \exp(-n)\sqrt{2\pi}$

Asymptotic properties of MLE

Consistency (or consistence, CB Sec 10.1.1)

- $T_n = T_n(X_1, \ldots, X_n)$ is consistent for θ iff $T_n \xrightarrow{p} \theta$ as $n \to \infty$
  - A sufficient condition for $T_n \xrightarrow{p} \theta$: $\mathrm{E}(T_n \mid \theta) \to \theta$ and $\mathrm{var}(T_n \mid \theta) \to 0$ as $n \to \infty$

Take-home exercises (NOT to be submitted; to be potentially covered in labs)
